

Promptathon:

Scenario Name: Shopping Cart

Weak Prompt

"Test the cart functionality."

What I Feel Is Missing

The prompt does not clearly define:

- The **features** of the shopping cart that need to be verified.
- The **user role/persona** responsible for testing.
- The **test scenarios and test cases** to be covered.
- The **types of users** to consider.
- The **checkout flow and payment options** to validate.
- The **calculation and pricing validations** required.
- The expected **output format** and validation criteria.

Instructions

1. Write comprehensive test cases for the **shopping cart checkout behavior**.
2. Cover all relevant **calculations, discounts, taxes, totals, and payment options** involved in the checkout process.
3. Consider different **user types and applicable user journeys**.
4. [HIGH PRIORITY] create only high priority test cases.

Context

The application is an **online shopping application**.

The objective is to validate the **checkout behavior of the shopping cart**

Example Test Case

TC001|TEST NAME|TEST DESCRIPTION|STEPS|CREATED BY|ENVIRONMENT

Persona

Senior QA Engineer

The QA Engineer should approach the validation with a focus on functional correctness, boundary conditions, negative scenarios, data accuracy, usability, and end-to-end checkout behavior.

Output Format

Provide the output in:

1. [STRICT] test cases should be created in table format
2. [MANDATORY] Create an excel sheet with consolidated test cases.

Tone

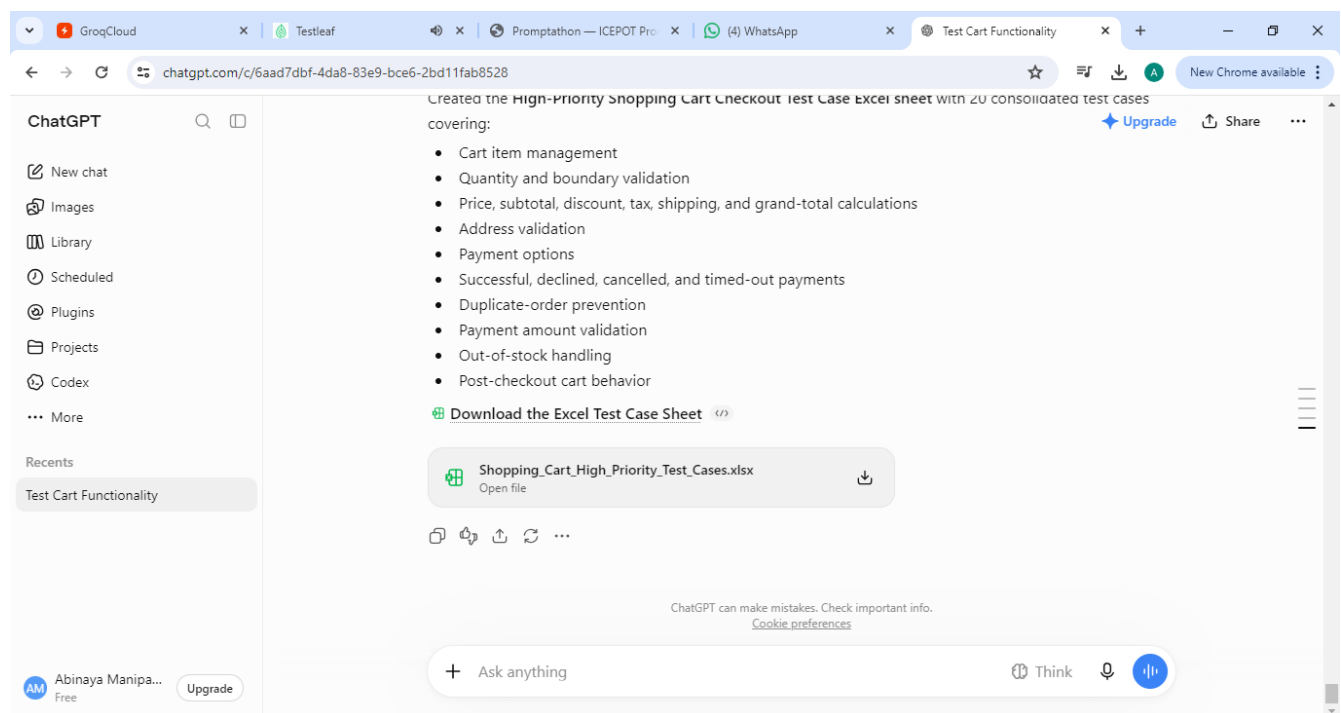

Formal, professional, and easy to understand.

Use clear and concise steps that can be understood and executed by QA engineers, developers, and business stakeholders.

Observations :

1. The PROMPT didn't provide the test cases sheet and table
2. The steps were not generated properly

O/P:

Scenario: File Upload

Weak: "Generate test cases for file upload."

What I feel missing:

The **application context**

- The **file upload feature** and expected behavior
- Supported **file types and extensions**
- Maximum/minimum **file size**
- ⑩ Number of files allowed
- ⑩ Valid and invalid file scenarios

- ⑩ File name and character validations
- ⑩ Duplicate file handling
- ⑩ Upload success and failure behavior
- ⑩ Network/interruption scenarios
- ⑩ Security-related validations
- Different **user types**
- ⑩ Required test case fields
- ⑩ Priority or test coverage expectations
- ⑩ Expected output format

Instructions:

[MANDATORY] Create Test cases that covers all the formats

[STRICTLY] Cover the high priority test cases

[ONLY] 15 Test cases

Context: To write test cases for file upload in the application.

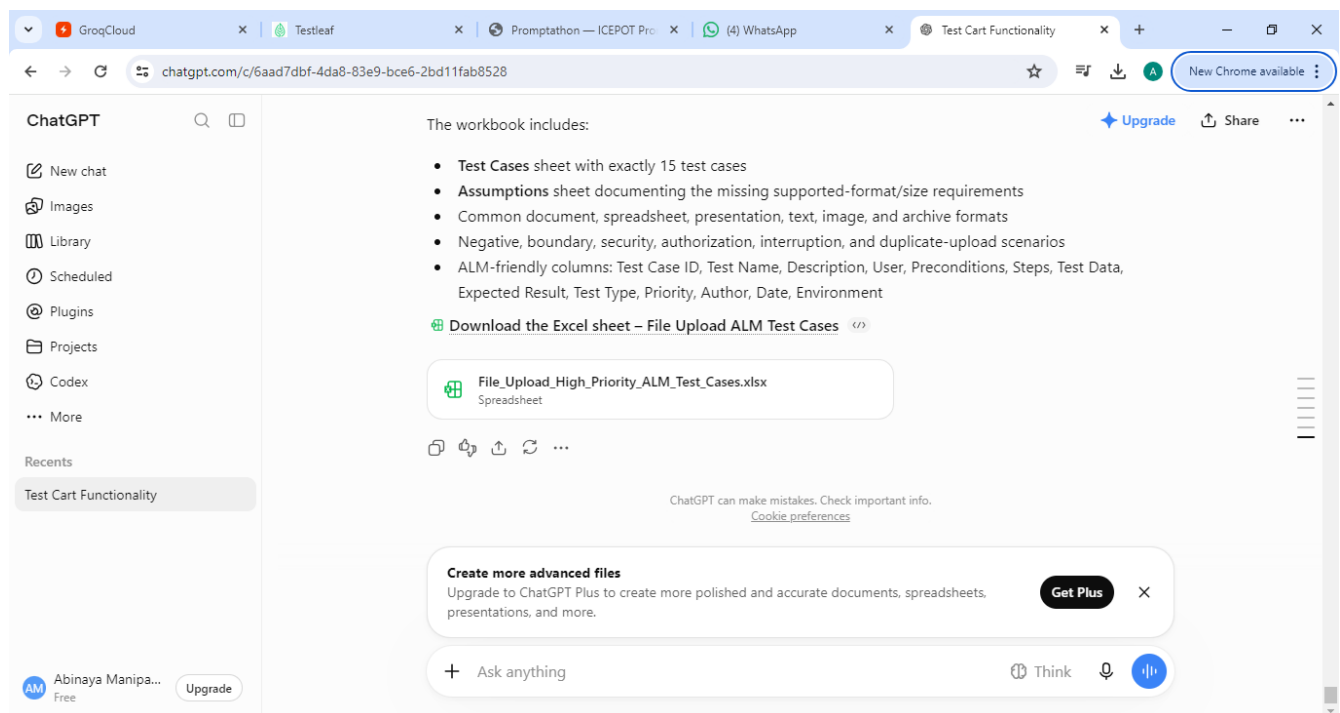

Examples: TC001 | upload the file | Admin | Steps | Author | Date | Env

Persona: Act as a Test Lead, create and review scenarios if all the edge cases are covered

Output: Need in Excel format to upload to ALM

Tone: Professional, Easily Understandable

Observation: The prompt was reduced the than the first scenario, was able to give more precise prompt and get the output with less attempts.

Scenario: API Testing

Weak Prompt: "Write API test cases for user registration."

What is missing?

- 10 HTTP status codes
- 10 Response schema and error messages
- 10 Database/data persistence validation
- 10 Security considerations
- 10 Different user types
- 10 Priority of test cases
- 10 Required number of test cases
- 10 Output format
- 10 Expected Excel/ALM structure

Instructions

Act as a **Senior API Test Lead** and create comprehensive test cases for the **User Registration API** of a web/mobile application.

Create test cases covering **functional, negative, boundary, validation, security, integration, and data-persistence scenarios**.

[HIGH PRIORITY]

Generate **only high-priority test cases** that could directly impact

Context

The application provides a **User Registration API** that allows a new user to create an account.

Example Test Case

TC001 | Successful user registration | Verify that a new user can be registered successfully using valid registration details.

Method: POST

Endpoint: /api/users/register

Request:

Response:

Persona

Senior API Test Lead

Review the generated scenarios to ensure that all critical registration paths and edge cases are covered.

Output Format

Test Case Table

[STRICT] Present all test cases in a structured table with these columns in excel format to upload to ALM

Test Case ID	Test Name	API Method	Endpoint	Test Description	Preconditions	Request Data	Test Steps	Expected Status Code
--------------	-----------	------------	----------	------------------	---------------	--------------	------------	----------------------

Tone: professional and easy

Test Cart Functionality

• API Method

• Endpoint

• Test Description

• Preconditions

• Request Data

• Test Steps

• Expected Status Code

The workbook also contains a **Requirement Clarifications** sheet for API details that were not specified, so no assumptions are incorrectly treated as requirements.
